

**Appendix to Amendment A**  
**With Replacement Paragraphs Marked-Up to Indicate Changes**

Commissioner for Patents

Washington, DC 20231

Sir:

Pursuant to Rule 121, the following is a copy of all the paragraphs amended by the attached Amendment A, with all changes indicated by bracketing deletions and underlining additions.

Page 17, last paragraph, replace with the following paragraph:

[To know how much fiber is required in the form assembly, knowledge from prior experience or testing is helpful. If baled fiber is to be used, and it is known that the fiber is baled to high standards, a shorthand method is to calculate the volume of compressed fiber required in the form after compression and the volume of the bales. From these two measurements, the number of bales required can be calculated.] Instrumentation on the compression equipment can be used to determine compression on the fiber. Instrumentation also makes it easier to vary the fiber compression in different parts of the process so as to regulate compressive strength and insulation value. It may be desirable to increase fiber density near the bottom of a wall in order to minimize structural compression. By the same token, fiber may be compressed less dense higher in a wall to enhance insulation value.
